KEI Workshop, Leuven, 5-6 September 2006

Types of measures

- **Measuring change (intertemporal).**
- **Measuring difference (interspatial).**
- **Ratio-type measure (p/p') will be called *index*.**
- **Difference-type measure ($p-p'$) will be called *indicator*.**

Three approaches for measuring aggregate price or quantity change (1)

- ***Economic approach.***
- **Keywords: preference order (consumer) or technology (producer); optimization; decomposition of value change.**
- **Literature: CPI Manual (ILO, Geneva, 2004) or PPI Manual (IMF, Washington DC, 2004).**

- ***Stochastic approach.***
- **Keywords: price change = common component + specific component + random component; estimation.**
- **Literature: Clements, Izan and Selvanathan, International Statistical Review 2006.**

Three approaches for measuring aggregate price or quantity change (2)

- ***Axiomatic approach.***
- **Keywords: properties; tests; functional equations.**
- **Literature: Balk, International Statistical Review 1995.**

Notation

- **Commodities $n = 1, \dots, N$**
- **Periods $t = 0, 1, \dots, T$**
- **Prices p_n^t**
- **Quantities x_n^t**
- **Single price indices p_n^1/p_n^0 ($n = 1, \dots, N$)**
- **Single quantity indices x_n^1/x_n^0 ($n = 1, \dots, N$)**

Price index $P(p^1, x^1, p^0, x^0)$: axioms

- **A1: Monotonous in prices.**
- **A2: Linearly homogeneous in period 1 prices:**
 $P(\lambda p^1, x^1, p^0, x^0) = \lambda P(p^1, x^1, p^0, x^0) \quad (\lambda > 0)$.
- **A3: Identity test: $P(p^0, x^1, p^0, x^0) = 1$.**
- **A4: Homogeneous of degree 0 in prices: $P(\lambda p^1, x^1, \lambda p^0, x^0) = P(p^1, x^1, p^0, x^0) \quad (\lambda > 0)$.**
- **A5: Invariant to changes in units of measurement:**
 $P(p^1 \Lambda, x^1 \Lambda^{-1}, p^0 \Lambda, x^0 \Lambda^{-1}) = P(p^1, x^1, p^0, x^0)$ (Λ diagonal with positive elements).

Quantity index $Q(p^1, x^1, p^0, x^0)$: axioms

- **A1': Monotonous in quantities.**
- **A2': Linearly homogeneous in period 1 quantities:**
 $Q(p^1, \lambda x^1, p^0, x^0) = \lambda Q(p^1, x^1, p^0, x^0) \quad (\lambda > 0)$.
- **A3': Identity test: $Q(p^1, x^0, p^0, x^0) = 1$.**
- **A4': Homogeneous of degree 0 in quantities:**
 $Q(p^1, \lambda x^1, p^0, \lambda x^0) = Q(p^1, x^1, p^0, x^0) \quad (\lambda > 0)$.
- **A5': Invariant to changes in units of measurement:**
 $Q(p^1 \Lambda, x^1 \Lambda^{-1}, p^0 \Lambda, x^0 \Lambda^{-1}) = Q(p^1, x^1, p^0, x^0) \quad (\Lambda \text{ diagonal with positive elements})$.

Some implications

- **A2 and A3 imply A6: Proportionality:**
 $P(\lambda p^0, x^1, p^0, x^0) = \lambda \quad (\lambda > 0).$
- **A1 and A6 imply A7: Mean value property:**
 $\min\{p_n^1 / p_n^0\} \leq P(p^1, x^1, p^0, x^0) \leq \max\{p_n^1 / p_n^0\}.$
- **A2' and A3' imply A6'.**
- **A1' and A6' imply A7'.**

Important tests

- **T1: Circularity (transitivity) :** $P(p^2, x^2, p^1, x^1) \times P(p^1, x^1, p^0, x^0) = P(p^2, x^2, p^0, x^0)$.
- **T2: Time reversal:** $P(p^1, x^1, p^0, x^0) = 1/P(p^0, x^0, p^1, x^1)$.
- **T1' and T2' similarly.**
- **T3=T3': Product:** $P(p^1, x^1, p^0, x^0) \times Q(p^1, x^1, p^0, x^0) = V^1/V^0$ (value ratio).
- **T4=T4': Factor reversal:** $P(p^1, x^1, p^0, x^0) \times P(x^1, p^1, x^0, p^0) = V^1/V^0$ or $Q(x^1, p^1, x^0, p^0) \times Q(p^1, x^1, p^0, x^0) = V^1/V^0$.

Other tests

- **T5 and T5': Value dependence.**
- **T6 and T6': Consistency-in-aggregation.**
- **T7 and T7': Equality.**
- **....**

Main areas of research in the axiomatic approach

- **Consistency of combinations of axioms and tests.**
- **Characterization of index formulas by axioms and tests.**

An important example (1)

- **T1 (transitivity)** implies that $P(p^1, x^1, p^0, x^0) = g(p^1, x^1) / g(p^0, x^0)$.
- **A3 (identity)** implies that $g(p, x) = g(p)$.
- **A5 (invariance to u-o-m)** implies that $g(p)/g(1)$ is a multiplicative function.
- **A1 (monotonicity)** implies (Aczél 1966) that $g(p)/g(1) = \prod_n p_n^{\alpha_n}$ for some $\alpha_n > 0$.
- **A2 (linear homogeneity)** implies that $\sum_n \alpha_n = 1$.

An important example (2)

- **Conclusion: A1, A2, A3, A5 and T1 imply that $P(p^1, x^1, p^0, x^0) = \prod_n (p_n^1 / p_n^0)^{\alpha_n}$ with $\alpha_n > 0$ and $\sum \alpha_n = 1$.**
- **This is known as the Cobb-Douglas (price) index.**
- **The α_n are constants.**
- **In practice one chooses α_n to be value share of period 0 or 1 or average \rightarrow T1 violated.**

An important example (3)

- Similarly, A1', A2', A3', A5' and T1' imply that $Q(p^1, x^1, p^0, x^0) = \prod_n (x_n^1 / x_n^0)^{\beta_n}$ with $\beta_n > 0$ and $\sum \beta_n = 1$.
- The β_n are (other) constants.
- In general $\prod_n (p_n^1 / p_n^0)^{\alpha_n} \times \prod_n (x_n^1 / x_n^0)^{\beta_n} \neq V^1 / V^0$; that is, T4 violated.

Application (1)

- Re-interpret (p, x) as vector of attributes, with p measured (as positive real variables) and x unmeasured.
- Composite index compares situation 1 to situation 0: $I(p^1, x^1, p^0, x^0)$.
- Invariance to units of measurement: $(p\Lambda, x)$ describes the same situation as (p, x) .
- Or, $I(p^1\Lambda, x^1, p^0\Lambda, x^0) = I(p^1, x^1, p^0, x^0)$.

Application (2)

- **Transitivity:** $I(p^2, x^2, p^1, x^1) \times I(p^1, x^1, p^0, x^0) = I(p^2, x^2, p^0, x^0)$. This implies that $I(p^1, x^1, p^0, x^0) = g(p^1, x^1) / g(p^0, x^0)$.
- **Identity:** $I(p^0, x^1, p^0, x^0) = 1$. This means that unmeasured variables are not relevant for comparing situations.
- Transitivity + Identity implies that $g(p^0, x^1) = g(p^0, x^0)$, thus $g(p, x) = g(p)$.
- Or, $I(p^1, x^1, p^0, x^0) = g(p^1) / g(p^0)$.

Application (3)

- **Invariance to u-o-m** then implies that $g(p^1 \Lambda) / g(p^0 \Lambda) = g(p^1) / g(p^0)$; that is, $g(p) / g(1)$ is a multiplicative function.
- If $g(p)$ is strictly *increasing*, which is a natural assumption, then Aczél's (1966) result implies that $I(p^1, x^1, p^0, x^0) = \prod_n (p_n^1 / p_n^0)^{\alpha_n}$ for some $\alpha_n > 0$.
- Imposing *linear homogeneity* means imposing that $\sum_n \alpha_n = 1$.

Conclusion

- Requirements like transitivity, identity, and invariance to u-o-m have implications for the form of the composite index.
- Theory, however, does not tell us how to choose the weights α_n of the single indices p_n^1/p_n^0 .
