

## Multilevel Monte Carlo path simulation

Prof. Mike Giles  
University of Oxford

In this talk I will present an approach to the numerical simulation of stochastic differential equations which borrows ideas from the multigrid solution of finite difference discretisations. The work is motivated by applications in computational finance, but no background in finance or stochastic analysis will be assumed. I will also give an overview of current research directions, including the use of NVIDIA graphics cards for massively-parallel computations.
